1 Intro

I have decided to use pdf_latex and papers to write my ReadMe from now on.

2 Build

There are two ways to build:

- naive fragile way is to write the main.rs:
\$ rustc main.rs
\$./main
\$ Hello, world!
- but the slightly trickier more robust way is to use cargo build:
\$ cargo new hello_cargo
\$ cd hello_cargo
...which lets you do \$ cargo build or \$ cargo run

As the docs say,

- create a project using \$ cargo new
- build a project using \$ cargo build
- build and run a project in one step using \$ cargo run
- build a project without producing a binary using \$ cargo check
- Cargo stores binaries in the target/debug directory.
- at p50 Urwin takes us through the #[test] attribute.
